TALENTRA DATABASE DESIGN HACKATHON

Milestone 7 — Entity Lists (B24–B26)

Status: Proposed draft for team review. These lists are based on the docket plus the separately labelled proposed entity baseline in the existing design package. They are not validated or approved.

1. What this milestone delivers

The docket assigns three entity-list tasks: B24 Administration (Member A), B25 Organisation and account (Member B), and B26 Gig marketplace (Member C). Milestone 7 identifies entities only; relationships, columns, and keys/constraints are handled in later milestones.

2. B24 — Administration entity list (Member A)

Proposed entity	Purpose / scope note
app_user	Application user identity/status; avoid the reserved-word table name `user`.
credential	Authentication identity and credential metadata; keep secrets such as password hashes out of app_user.
role	Named access role.
permission	Permission/action definition.
user_role	Mapping between users and roles.
role_permission	Mapping between roles and permissions.
user_session	Session/device lifecycle and revocation.
consent_record	User consent history where required.
audit_event	Append-only audit trail for security and business actions.
block_entry	Blocking relationship between two parties, if this function is in the agreed requirements.

3. B25 — Organisation and account entity list (Member B)

Proposed entity	Purpose / scope note
organisation	Employer/client legal and display identity, status, and industry reference.
organisation_location	Organisation office/site/location records.
organisation_identifier	Registration/tax identifiers as text with country/type; apply protection rules.
organisation_verification	Verification status and evidence reference/history.
recruiter_organisation_mapping	Recruiter-to-organisation assignment with valid_from/valid_to dates.
account	Organisation/customer account or tenant context; exact boundary with app_user needs team agreement.
account_admin	Mapping between an account and its administrators.
organisation_hierarchy	Parent/child organisation relationship if hierarchy is required.

4. B26 — Gig marketplace entity list (Member C)

Proposed entity	Purpose / scope note
gig_worker_profile	Worker-facing marketplace profile, linked to the appropriate user/profile identity.
gig_service	Service types or offerings provided by workers, if catalogue behaviour is required.
gig_availability	Worker availability windows; must support overlap checks against assignments where required.
gig_request	Request created by a user or organisation, with scope, time window, status and pricing model.
gig_application	Worker response/application to a gig request.
gig_assignment	Accepted/confirmed work engagement resulting from an application/request.
gig_handoff	Reference to external handoff or completion workflow, where needed.
gig_earnings_snapshot / external reference	Keep financial integration boundary explicit; decide whether values are snapshots or externally owned records.
gig_worker_list_entry	Saved/curated worker list entry, only if this feature is in scope.

Proposed entity	Purpose / scope note
gig_rating	Rating/review tied to a completed assignment.

5. Cross-module boundaries and decisions to resolve

• Administration owns user, credential, role, permission, session, consent and audit concepts; Profile may reference the user/account identity but should not duplicate authentication secrets.

• Organisation and account owns employer/client organisation records and recruiter mappings; Jobs & Applications should reference these records rather than define a second organisation entity.

• Gig marketplace references the requesting user/organisation and the worker identity; clarify whether gig workers reuse candidate_profile or require a separate gig_worker_profile.

• Choose canonical names and maintain one entity list as the source of truth. Proposed entities are not automatically mandatory just because they appear here.

• Confirm whether consent_record, block_entry, gig_service, gig_handoff, earnings references, worker lists, ratings, and organisation hierarchy are in the agreed requirements.

• Do not design relationships or columns in Milestone 7 beyond a short purpose/scope note. Those belong to Milestones 8 and 9.

• Mark each entity ACCEPTED, REVISE, or OUT OF SCOPE at team review; record owner and rationale for any addition/removal.

6. Milestone 7 acceptance checklist

• B24 Administration entity list reviewed by Member A and the team.

• B25 Organisation and account entity list reviewed by Member B and the team.

• B26 Gig marketplace entity list reviewed by Member C and the team.

• Every entity has a concise purpose and a clear owning module.

• No duplicate ownership of user identity, organisation, profile, or Master Data definitions.

• Names and scope are reconciled with the original docket and existing Phase 1 design.

• Team records approval and unresolved items before proceeding to Milestone 8 (B27–B29).

Source vs proposal: The docket explicitly requires entities for users/roles/permissions/audit trail; organisations/locations/account administrators; and gig requests/worker profiles/availability/applications. The detailed names above are proposed entity choices drawn from the existing design package and should be accepted or changed by the team.
